The compounds of general I and their pharmaceutically acceptable salts exhibit pharmacological activity and accordingly are of use for the preparation of pharmaceutical compositions and in the treatment of humans and other animals. More especially, they are cyclic AMP phosphodiesterase inhibitors, in particular type IV cyclic AMP phosphodiesterase inhibitors, and thus the present invention provides compounds of general formula I and their pharmaceutically acceptable salts, and compositions containing compounds of general formula I and their pharmaceutically acceptable salts, which are of use in a method for the treatment of a human or animal patient suffering from, or subject to, conditions which can be ameliorated by the administration of an inhibitor

of cyclic AMP phosphodiesterase, for example, they are useful as bronchodilators and asthma-prophylactic agents and agents for the inhibition of eosinophil accumulation and of the function of eosinophils, e.g. for the treatment of inflammatory airways disease, especially reversible airway obstruction or asthma, and for the treatment of other diseases and conditions characterised by, or having an aetiology involving, morbid eosinophil accumulation. As further examples of conditions which can be ameliorated by the administration of inhibitors of cyclic AMP phosphodiesterase such as compounds of general formula I there may be mentioned inflammatory diseases, such as atopic dermatitis, urticaria, allergic rhinitis, psoriasis, rheumatic arthritis, ulcerative colitis, Crohn's disease, adult respiratory distress syndrome and diabetes insipidus, other proliferative skin diseases such as keratosis and various types of dermatitis, conditions associated with cerebral metabolic inhibition, such as cerebral senility, multi-infarct dementia, senile dementia (Alzheimer's disease), and memory impairment associated with Parkinson's disease, and conditions ameliorated by neuroprotectant activity, such as cardiac arrest, stroke, and intermittent claudication.

According to a further feature of the invention there is provided a method for the treatment of a human or animal patient suffering from, or subject to, conditions which can be ameliorated by the administration of an inhibitor of cyclic AMP phosphodiesterase, for example conditions as hereinbefore described.

Compounds within the scope of the present invention exhibit positive pharmacological activities as demonstrated by the following tests which are believed to correlate to pharmacological activity in humans and other mammals.

Compounds of the invention at concentrations from about 10^{-9} M up to about 10^{-6} M produced about 50% inhibition of porcine aorta cyclic AMP phosphodiesterase.

Compounds of the invention at concentrations of about 10^{-7} M to about 10^{-4} M produced about 50% relaxation of guinea-pig tracheal strips, which had been contracted by treatment with spasmogens such as histamine and carbachol.

Compounds of the invention at intraperitoneal doses from about 1 to about 25 mg/kg or at oral doses from about 1 to about 50 mg/kg inhibited by about 50% the accumulation of eosinophils in the lungs of guinea-pigs.

Compounds of the invention at concentrations from about 10^{-8} M up to about 10^{-5} M produced about 50% inhibition of superoxide generation from eosinophils harvested from the peritoneal cavities of guinea-pigs.

Compounds of the invention at oral doses from about 1 to about 50 mg/kg administered 1 hour before challenge inhibited by about 50% ovalbumin- or PAF-induced hyperreactivity in guinea-pigs.

Bronchorelaxant activity was measured in *in vivo* tests in the anaesthetised guinea-pig according to the method of Dixon and Brodie [J. Physiol., 29, 97-173, (1903)] in which the effects on histamine-induced bronchospasm and mean arterial blood pressure were determined.

Nebulised aerosols generated from aqueous solutions of compounds of the invention were each administered for one minute to the anaesthetised guinea-pigs.

Alternatively, dry powder formulations made up from compounds of the invention and lactose were blown into the airways of the anaesthetised guinea-pigs.

Compounds of the invention produced from about 30% up to about 90% decrease in bronchospasm when administered at effective doses of about 20-80 μ g, without any significant effect on blood pressure.

Compounds of the invention as oral doses of about 1 to about 50mg/kg, administered one hour before challenge, inhibited by at least 50% ovalbumin-induced eosinophilia in guinea-pigs, which is measured 24 hours after challenge.

Administered at doses of about 1 to about 50mg/kg orally or parenterally or at doses of about 20 to about 500mg intratracheally, compounds of the invention inhibit PAF or ovalbumin-induced microvascular leakage (measured using fluorescein isothiocyanate dextran) by up to 100% in guinea-pigs.

The value of the compounds of the invention is enhanced by their very low mammalian toxicity levels.

Compounds of formula (I) can be prepared by the application or adaptation of known methods, by which is meant methods used heretofore or described in the literature.

Thus, according to a feature of the present invention, compounds of general formula I, wherein R^1 , R^2 and R^3 are as hereinbefore defined and Z represents an oxygen atom, are prepared by the reaction of compounds of general Formula II hereinafter depicted, wherein R^1 and R^2 are as hereinbefore defined and X^1 represents a halogen, e.g. bromine or, preferably, chlorine atom, with compounds of the general formula:-

By the term "pharmaceutically acceptable salts" as used in this specification is meant salts the counter ions of which are relatively innocuous to the animal organism when used in therapeutic doses so that the beneficial pharmaceutical properties of the parent compounds of general formula I are not vitiated by side-effects ascribable to those counter ions.

Suitable acid addition salts for use in pharmaceuticals may be selected from salts derived from inorganic acids, for example hydrohalides, e.g. hydrochlorides and hydrobromides, phosphates, sulphates and nitrates, and organic acids, for example oxalates, lactates, tartrates, acetates, salicylates, citrates, propionates, succinates, fumarates, maleates, methylene-bis- β -hydroxynaphthoates, gentisates, mesylates, isethionates and dip-toluoyltartrates.

As will be self-evident to those skilled in the art, some of the compounds of general formula I do not form stable salts. However, acid addition salts are most likely to be formed by compounds of formula I wherein

R³ represents a nitrogen-containing heterocyclyl group and/or wherein R³ contains an amino group as a substituent.

According to a further feature of the invention, acid addition salts of compounds of formula I are prepared by reaction of the parent compounds of formula I with the appropriate acid, by the application or adaptation of known methods.

Alkali and alkaline earth metal salts are also suitable for use in pharmaceuticals, especially sodium salts.

According to a further feature alkali and , alkaline earth metal salts are prepared by reaction of the parent compounds of formula I with the appropriate base, by the application or adaptation of known methods. For example, sodium salts can conveniently be prepared by reaction with sodium hydride.

As well as being useful in themselves as active compounds, salts of compounds of formula I are useful for the purposes of purification of the parent compounds of formula I, for example by exploitation of the solubility differences between the salts and the parent compounds, by techniques well known to those skilled in the art.

The parent compounds of formula I can be regenerated from their salts by the application or adaptation of known methods.

For example, parent compounds of general formula I can be regenerated from their acid addition salts by treatment with an alkali, e.g. aqueous sodium bicarbonate solution or aqueous ammonia solution.

Similarly, parent compounds of general formula I can be regenerated from their alkali and alkaline earth metal salts by treatment with an acid, e.g. hydrochloric acid.

In this specification reference to compounds of formula I is intended to include reference to their pharmaceutically acceptable salts, where the context so permits.

It will be apparent to those skilled in the art that certain compounds of general formula I can exhibit isomerism, for example optical isomerism. All isomers within general formula I, and their mixtures, are within the scope of the invention.

Such isomers can be separated from their mixtures, by the application or adaptation of known methods, for example chromatographic techniques, or they may be separately prepared from the appropriate isomers of their intermediates, for example by the application or adaptation of methods described herein.

The starting materials and intermediates can be prepared by the application or adaptation of known methods, for example methods as described in the Reference Examples or their obvious chemical equivalents.

For example, compounds of formula II can be prepared from compounds of general formula Va, hereinafter depicted, wherein R¹ and R² are as hereinbefore defined, by the application or adaptation of known methods for the preparation of acid halides from carboxylic acids. For example, when X¹ represents a chlorine atom, the reaction can be carried out by means of thionyl chloride.

Compounds of formula Va can be prepared by the oxidation of compounds of general formula VI, hereinafter depicted, wherein R¹ and R² are as hereinbefore defined, e.g. by means of reaction with potassium permanganate, or with a mixture of sulphamic acid and sodium chlorite in acetic acid.

Compounds of formula VI can be prepared from compounds of general formula VII, hereinafter depicted, wherein R¹ is as hereinbefore defined, by reaction with compounds of formula V as hereinbefore defined, or alternatively by reaction with compounds of the general formula:-

wherein R² is as hereinbefore defined, preferably in the presence of a compound such as diisopropyl azodicarboxylate.
